

AirDriy motorcycle de-humidifier

HOW IT WORKS

AirDriy motorcycle de-humidifier absorbs the excess moisture from the air. This prevents fungus, rust, mould stains and musty odours. The moisture is absorbed by storage granules. AirDriy can absorb up to 600 g of water. AirDriy is odourless. Depending on the humidity and temperature, the dehumidification function is effective for 2-4 months. AirDriy absorbs moisture even if the relative humidity level is very high of over 60 percent. The moisture is released back when the air is dry. It thus works only when the humidity is very high and has a compensating effect on the indoor climate when the humidity level changes.

HOW TO USE

AirDriy is activated by removing the protective bag. Direct contact with products at risk of rusting should be avoided for reasons of moisture transfer. The degree of saturation (maximum 1.6 kg) can be determined by weighing.

HOW TO RE-ACTIVATE

AirDriy can be dried in an oven (not a microwave) or on a heater and reused. If using an oven for drying, place AirDriy on a wire shelf in the middle and set the oven temperature to about 175°C. Temperatures higher than this may damage the fabric of the bag. The drying process takes about 4-5 hours. In case of standard oven the cost of drying is about £1. If AirDriy is dried on a radiator the drying process takes several days.

WARNINGS

There is a possible risk of burn if the heated bag and especially the metal clamp is touched. For removing the bag from the oven use oven mitts or hand gloves. Product contains salt - Avoid eye contact.
